09 · IN-APP NOTICES

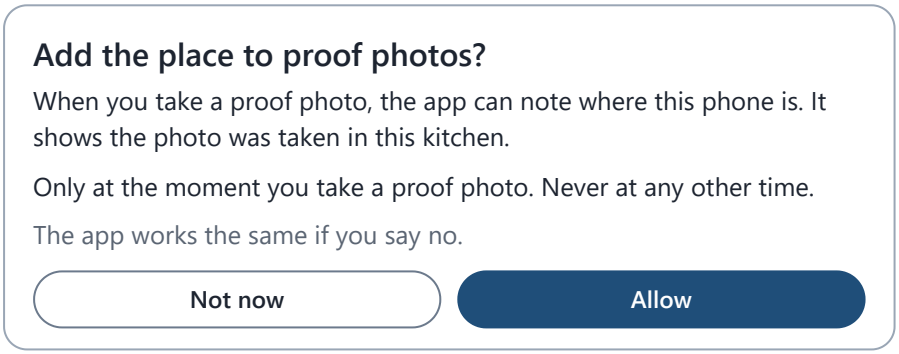

Permission requests: location, camera, microphone, notifications

Every question the app asks before it uses the phone's location, camera, photos, microphone or notifications, with the reasons it gives in the phone's own permission boxes.

Android and iPhone show their own permission box the first time the app needs a sensor. For the two that may surprise people (location and the microphone) and for notifications, the app first asks its own plain question, and the phone's box comes only after "Allow". Saying no never stops the rest of the app working.

1. Location on proof photos

THE APP'S OWN QUESTION, BEFORE THE PHONE'S BOX (RESTAURANT USERS AND STAFF)

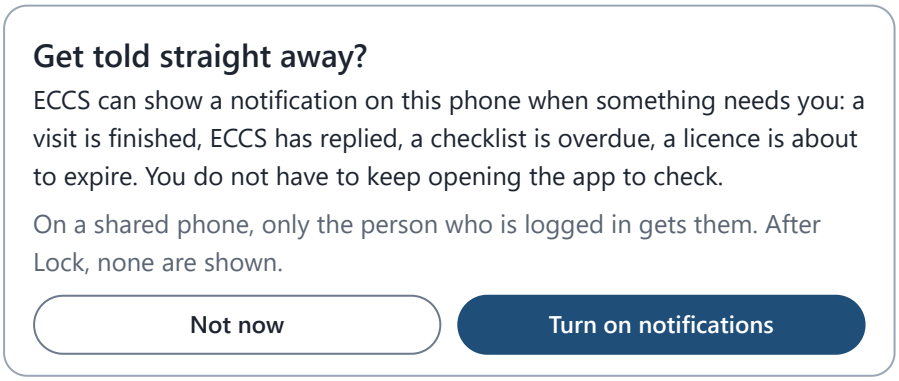

What is saved: with each proof photo, where the phone was, how accurate that was, the distance from the outlet, and whether Android reported the location as coming from a "mock location" app. Never in the background: the app does not ask for background location at all.

ECCS's Supervisors also save an outlet's location once ("Save it once, while you are in the kitchen. It is used to check that proof photos were taken here. Needs signal."), and the app records where the Supervisor's phone was when they tap "I have arrived: check in" at a visit, with the distance from the outlet. The check-in button's hint does not mention location: "Tap when you reach the outlet. You can then record the work."

2. Notifications

THE APP'S OWN QUESTION, BEFORE THE PHONE'S BOX

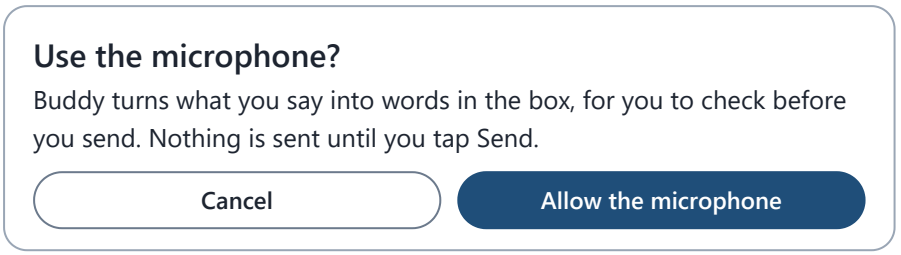

Notification text can include an outlet's name, a task, or an employee's name in an attendance alert. It is delivered through Expo's push service and Google's Firebase Cloud Messaging (Apple's push service for

iPhones), which may process it outside India.

3. Microphone and speech recognition (ECCS Buddy only)

THE APP'S OWN QUESTION, THE FIRST TIME SOMEONE TAPS "SPEAK" IN ECCS BUDDY

The phone's own speech recognition turns speech into text in the message box: on Android usually Google's service, on an iPhone Apple's, which may process the voice on their servers. ECCS receives only the text, and only if the person taps Send.

4. The phone's own permission boxes: the app's reason lines

iPhones show these words in the system box. Android shows its standard box without them, which is why the app asks its own question first for location, notifications and the microphone.

Permission	The reason the app gives, word for word
Microphone	ECCS uses the microphone only when you tap Speak in ECCS Buddy, to turn what you say into words you check before sending.
Speech recognition	ECCS uses the phone's speech recognition to turn what you say to ECCS Buddy into words in the box, for you to check before sending.
Camera	ECCS uses the camera to clock staff in and out by face and to take proof photos.
Photos	ECCS lets you choose a photo or a document you already have, such as a licence.
Location while using the app	ECCS notes where the phone is when you take a proof photo, to show the photo was taken in the kitchen. Only at that moment.

Background location ("always"), motion sensors and Android background location are switched off in the app's settings, so the app cannot ask for them.

Points for the lawyer

1. Google Play requires a clear explanation inside the app before Android's own box when collecting data may surprise the user. Are the questions above enough?
2. The Supervisor's visit check-in records their location (ECCS staff data), and the check-in wording does not say so. Should it, or is the staff notice (document 12) the place?
3. Notification text may include an employee's name and passes through US push services. The drafter suggested wording attendance alerts without names if staff names must stay in India.
